On the third, at the seventh hour, the stars were arranged in this
 sequence. The eastern one was 1 minute, 30 seconds from Jupiter
 and the closest western one 2 minutes; and the other western one was
 3 minutes removed from this one. They were absolutely on the same
 straight line and of equal magnitude.

On the fourth, at the second hour, there were four stars around
 Jupiter, two to the east and two to the west, and arranged precisely
 on a straight line, as in the adjoining figure. The easternmost was
 3 minutes distant from the next one, while this one was 40 seconds
 from Jupiter; Jupiter was 4 minutes from the nearest western one
 and this one 6 minutes from the westernmost one. Their magnitude
 were nearly equal; the one closest to Jupiter appeared a little smaller
 than the rest. But at the seventh hour the eastern stars were only
 30 seconds apart. Jupiter was 2 minutes from the nearer eastern
 one, while he was 4 minutes from the next western one, and this
 one was 3 minutes from the westernmost one. They were all equal
 and extended on the same straight line along the ecliptic.

On the fifth, the sky was cloudy.

On the sixth, only two stars appeared flanking Jupiter, as is seen
 in the adjoining figure. The eastern one was 2 minutes and the
 western one 3 minutes from Jupiter. They were on the same straight
 line with Jupiter and equal in magnitude.

On the seventh, two stars stood near Jupiter. Both to the east

A variety of research on human cognition demonstrates that humans learn and communicate best when more than one processing system (e.g. visual, auditory, touch) is used. And, related work shows that, no matter how technical the material, most humans also retain and understand information best when they can put a narrative "story" to it. So, when considering the future of communication, we should be careful not to do blithely away with the linear format that articles and books have followed for centuries: instead, we should enrich it.

In scientific text, as in talks or small discussions, these figures are often the focus of the discussion. Figures, which include images, diagrams, charts, and more, have enriched scholarly articles since the time of Galileo, and ever-growing volumes of data underpin most scientific papers. When scientists communicate face-to-face, as in talks or small discussions, these figures are often the focus of the discussion. In the best discussions, scientists have the ability to manipulate the figures, and to interact with the data, in real-time, so as to test out various what-if scenarios, and to explain things more clearly. **This short article explains—and shows with demonstrations—how "papers" can morph into long-lasting rich records of scientific discourse, with rich metadata and code linkages, interactive figures, audio, video, and commenting.**

Many good suggestions, but if the goal is "long-lasting rich records of scientific discourse", a more careful and critical attitude towards electronic artifacts is appropriate. I do see it concerning videos, but not a word on the much more critical situation in software. Archiving source code is not sufficient: all the dependencies, plus the complete build environment, would have to be conserved as well to make things work a few years from now. An "executable figure" in the form of an IPython notebook will...

- Merce Crosas** 3 days ago · Public
Konrad, good points; this has been a concern for the community working on reproducibility. Regarding data repositories, Dataverse handles long-term preservation and access of data files in the following way: 1) for some data files that the repository recognizes (such as R Data, SPSS, STATA), which depend on a statistical package, the system converts them into a preservation format (such as a tab/CSV format). Even though the original format is also saved and can be accessed, the new preservation format guarantees...

- Konrad Hinsien** 1 day ago · Public
That sounds good. I hope more repositories will follow the example of Dataverse. Figshare in particular has a very different attitude, encouraging researchers to deposit as much as possible. That's perhaps a good strategy to change habits, but in the long run it could well backfire when people find out in a few years that 90% of those deposits have become useless.

John Huchra's Universe

The screenshot shows the WorldWide Telescope website interface. At the top, there is a navigation bar with links for HOME, ABOUT, LEARN WWT, FIND TOURS, EDUCATORS, AMBASSADORS, COMMUNITY, and GET WWT. A search bar is located on the right side of the navigation bar. Below the navigation bar, there is a sidebar on the left with a list of links: Home, About, Learn WWT, Find Tours, Educators, Ambassadors, Community, and Get WWT. The main content area displays the title "John Huchra's Universe" and indicates it was submitted by "patudom" on Jan. 11. There are icons for "Download" and "YouTube". A paragraph of text follows, stating: "John Huchra, former president of the American Astronomical Society, passed away on October 8, 2010. John's colleagues at the Harvard-Smithsonian Center for Astrophysics, in collaboration with the creators of WorldWide Telescope at Microsoft Research, have created a new, interactive, WWT Tour to honor John and his career."

This WorldWide Telescope Tour was created to thank John Huchra (1948-2010) for the knowledge and cheer he gave us all.

SNEAK PREVIEW: GLUE IN THE BROWSER (FALL 2018)

The screenshot displays the JupyterLab interface with several components:

- Code Editor:** Shows the command `app.scatter3d('x', 'y', 'z');` in a cell.
- Output View:** Contains a histogram of data points. The x-axis is labeled 'z' and ranges from -3 to 1.5. The y-axis is labeled 'Number' and ranges from 0.00 to 70.00. The histogram bars are black, with a few highlighted in orange.
- 3D Scatter Plot:** A 3D visualization of data points in a coordinate system with axes x, y, and z. The points are colored in shades of orange and yellow.
- Modal Menu:** A central dialog box titled "Start a new activity" with three options: "Notebook", "Code Console", and "Text Editor".
- Toolbar:** Includes various interactive tools like "lasso", "circle", and "brush x".

New Thinking on, and with, Data Visualization

Alyssa A. Goodman, Michelle A. Borkin, Thomas P. Robitaille

As the complexity and volume of datasets have increased along with the capabilities of modular, open-source, easy-to-implement, visualization tools, scientists' need for, and appreciation of, data visualization has risen too. Until recently, scientists thought of the "explanatory" graphics created at a research project's conclusion as "pretty pictures" needed only for journal publication or public outreach. The plots and displays produced during a research project – often intended only for experts – were thought of as a separate category, what we here call "exploratory" visualization. In this view, discovery comes from exploratory visualization, and explanatory visualization is just for communication. Our aim in this paper is to spark conversation amongst scientists, computer scientists, outreach professionals, educators, and graphics and perception experts about how to foster flexible data visualization practices that can facilitate discovery and communication at the same time. We present an example of a new finding made using the glue visualization environment to demonstrate how the border between explanatory and exploratory visualization is easily traversed. The linked-view principles as well as the actual code in glue are easily adapted to astronomy, medicine, and geographical information science – all fields where combining, visualizing, and analyzing several high-dimensional datasets yields insight. Whether or not scientists can use such a flexible "undisciplined" environment to its fullest potential without special training remains to be seen. We conclude with suggestions for improving the training of scientists in visualization practices, and of computer scientists in the iterative, non-workflow-like, ways in which modern science is carried out.

TEN QUESTIONS TO ASK WHEN CREATING A VISUALIZATION

The 10 Questions

1. **Who** | Who is your audience? How expert will they be about the subject and/or display conventions?
2. **Explore-Explain** | Is your goal to explore, document, or explain your data or ideas, or a combination of these?
3. **Categories** | Do you want to show or explore pre-existing, known, human-interpretable, categories?
4. **Patterns** | Do you want to identify new, previously unknown or undefined patterns?
5. **Predictions & Uncertainty** | Are you making a comparison between data and/or predictions? Is representing uncertainty a concern?
6. **Dimensions** | What is the intrinsic number of dimensions (not necessarily spatial) in your data, and how many do you want to show at once?
7. **Abstraction & Accuracy** | Do you need to show all the data, or is summary or abstraction OK?
8. **Context & Scale** | Can you, and do you want to, put the data into a standard frame of reference, coordinate system, or show scale(s)?
9. **Metadata** | Do you need to display or link to non-quantitative metadata? (including captions, labels, etc.)
10. **Display Modes** | What display modes might be used in experiencing your display?

Linked-View Exploratory Visualization of High-Dimensional Data, for Everyone

Alyssa Goodman (PI, Harvard)
Michelle Borkin (PI, Northeastern)
Thomas Robitaille (Lead Architect)

The glue project was founded in 2012, with funding from NASA's James Webb Space Telescope (JWST) project. NASA contracts continue to support development of JWST-related (Astronomy) functionality.

Beginning in 2017, glue has also been funded by the National Science Foundation, under SI2-SSE 1739657/1740229: Collaborative Research: A sustainable future for the glue multi-dimensional linked data visualization package. The goal of the NSF SSE funding is to expand glue's functionality into domains beyond its traditional strengths in Astronomy and Medicine, by broadening both its user and developer communities. All glue code is Open Source, at github.com/glue-viz

Linked Visualizations
With Glue, users can create scatter plots, histograms and images (2D and 3D) of their data. Glue is focused on the brushing and linking paradigm, where selections in any graph propagate to all others.

Flexible linking across data
Glue uses the logical links that exist between different data sets to overlay visualizations of different data, and to propagate selections across data sets. These links are specified by the user, and are arbitrarily flexible

Full scripting capability
Glue is written in Python, and built on top of its standard scientific libraries (i.e., Numpy, Matplotlib, Scipy). Users can easily integrate their own python code for data input, cleaning, and analysis.

Want to plug-in your project or tool?
Consider joining us for **glue-con**, right after **JupyterCon**, August 27-29, 2018, at Harvard.
